

Lexmark makes it easy to put more into your
Interwoven WorkSite . . . so you can get more out of it.

Your law firm's Interwoven WorkSite electronic document management system (EDMS) makes it easy to access documents when needed. But what isn't so easy is getting all of the documents your firm generates into Interwoven WorkSite in the first place.

Whether you scan documents to e-mail or send them to a centralized facility for scanning, it takes multiple steps and multiple devices to get the job done.

Before being imported into Interwoven WorkSite, documents typically must be scanned, converted and profiled with data. That's a complicated, time-consuming process. As a result, secretaries spend valuable time away from their desks processing documents. More computer memory is needed as hard drives bulge with duplicate copies of documents that were previously profiled and placed into Interwoven WorkSite. Lawyers may even bypass the EDMS entirely to expedite important client paperwork.

Interwoven WorkSite on ramp.

Lexmark multifunction devices put documents directly into Interwoven WorkSite in one simple step, functioning as a high-speed "on ramp" to your EDMS. Documents are both captured and profiled at the point of origin with Lexmark's easy-to-use, customizable one-button technology. Or choose the Virtual Barcode Coversheet option, and profile your document directly from your desktop via a web browser. Then print the barcode coversheet at your closest printer, and place it on top of the document for auto entry when scanned.

With Interwoven WorkSite working at full potential, documents are available faster, scanning costs are reduced and secretaries can stay focused on clients' and lawyers' needs.
